### **Quantity Discount pricing in ShopSite**

Product: ALL

Version: ALL

Platform: ALL

Is there a way to setup the program to calculate quantity discounts? If the price of an item is lower based on the quantity ordered from the checkout page, can the system calculate this? For example, if purchasing a single product, the price is \$10. But if purchasing 2 or more, the price is \$9 each. By placing the '2' in the quantity box on the checkout page and hitting 'Recalculate', can the program calculate 2 x \$9 rather than 2 x \$10. Solution ID: S02811

In ShopSite Pro v6.3 a Product Quantity Pricing feature was added, see the Quantity Pricing fields and tables in Products -> Edit Product Info or Add a Product (available in Advanced Editing mode only).

With ShopSite Pro versions 6.2x and earlier, you can do order discounts by total cart value (feature found in Merchending -> Discount Schedule) but not quantity discounts on a per product basis like outlined above.
