### **7.1.1 maintenance release fixes some problems with initial v7.1**

Product: ALL

Version: v7.1

Platform: ALL

I have ShopSite v7.1 and am experiencing some technical problems, are there any patches or new releases available?

Solution ID: S5497

Yes, maintenance releases v7.1.1 and v7.1.2 are now available. A list of fixes to v7.1 that are found in the v7.1.1 maintenance release is listed below. A newer v7.1.4 maintenance release includes all of these fixes, and additionally addresses the issues listed in kbase solution S5501 and kbase solution S5505. It is recommended that you update to that newer v7.1.4 version.

The v7.1.1 maintenance release addresses the issues listed below:

#### **SHOPPING CART**

- \* Resolved an issue where shoppers whose name on their credit card contains a lowercase 'x' may have received an error message 'Please specify a valid value for the Name on Card'.
- \* The Human Validation image on the checkout screen will now use the 'Shopping Cart secure URL' instead of the regular shopping cart URL if SSL security is enabled for the shopping cart.
- \* Shopping Cart button images selected from the store's media directory via the 'Select' button in the Preferences -> Store Text menus will now use the 'Store Images secure URL' setting if SSL security is enabled.
- \* The Gift Certificate footer will now display and the Back to Store button will work if UPS shipping is enabled.
- \* Warning messages about selecting a shipping and/or payment method will not be displayed if all products have been removed from the shopping cart.
- \* WorldPay now uses the correct 'testMode' value for live (non-test) transactions.
- \* Multiple 'select' values in shopping cart Custom Checkout Fields are now passed correctly through the checkout process.
- \* Email receipts will now be sent correctly for stores where the merchant email address was configured to contain a description in square brackets ( [ ] ) before or after the email address setting.
- \* If using the VeriSign Payflow Pro payment gateway, credit card orders will now be rejected if the 'Reject on CVV2 failure' option is checked and the CVV2 return code from VeriSign indicated that the CVV2 code was incorrect.

#### **BACKOFFICE**

- \* The link on the 'Add a Page' screen to switch image selection from the drop-down list method to the pop-up window method now works. This link only displays if there are too many images to use the drop-down method.
- \* CSS file used on some backoffice screens is fixed to not read yellow background image from an incorrect location, which had caused some backoffice screens to have a plain white background.
- \* Coupons containing quote marks (") in the Name or Alternate Code fields can be edited successfully.

#### **MISCELLANEOUS**

- \* Fixed an issue where, in certain circumstances, complete 'img src= ' HTML tags used in the 'Add to Cart button' text setting were having the quote marks replaced in the wrong place when put on the generated pages, which caused the image to be broken.
- \* The Coupon database can now be properly upgraded if a coupon contains a quote (") character in the Name or Alternate Code fields.
- \* Indexing and display of subproducts found in the search results has been improved.

#### **TEMPLATES**

- \* Added a search template tag [-- SEARCHPRODUCTLINK --] that will add an anchor such as #[product\_number] to search result links so that clicking the link will result in the target page loading to the specific location of the product on that page. The default search\_link template was modified to use the new

tag.
